

What I Have Learned from This Project

When I came across this assignment/Project I came to know new things and their use cases, and I feel spending time on this was worthy. The things I have learned-

1. As I know Django and project structure well, but again I have implemented what I learned.
2. I have learned to create and connect multiple apps in a single Django project.
3. Came across models.py and database.
4. While creating the ER diagram I came across a new Website “**Lucidchart**” , which is helped to create ER diagram in many ways like with its AI prompt as well as drag and drop ready made options for creating ER-diagram.
5. Created APIs and tested on Browser and POSTMAN.
6. I came across files like “services.py”, “serializer.py” and their use cases in this project.
7. Came to know about the logic for packing product and 3D packing concepts and product rotation.
8. As this system was recommendation system/suggestion system which will suggest the exact eligible box.
9. Came to know about the HTTP methods like “POST”, “GET” and “OPTION”.
10. The most important thing is that before this, I never worked on automated testing. I came to know regarding tests.py file for automation testing. Before now I worked on manual testing using POSTMAN/Thunder, which was used to test the API endpoints manually.
11. Learning to install dependencies when encountered with errors,
12. Used AI suggestions for understanding and reviewing the code.
13. Came across to create the documents like
14. TEST_CASES.md and TEST_OUTPUT.md.
15. Separating business logic into services.py.
16. Learned to create and organize the files and logic for easy debugging.
17. Learned about various errors of wrong and correct request like 200, 404, 400, etc.
18. Configure the admin and register the models in the admin panel.
19. Create db and various constraints of different tables.
